Abstract:
It has already been reported that 1-methylnicotinamide (MNA), a primary metabolite of nicotinamide (vitamin B3), possesses remarkable anti-inflammatory properties [3]. This communication shows that 1-methyl-N’-(hydroxymethyl)nicotinamide (MNAF) can be regarded as MNA precursor able to release simultaneously formaldehyde. Therefore, MNAF can be viewed as a candidate for drug with the combined anti-inflammatory and anti-bacterial properties.

Key words:
1-methyl-N’-(hydroxymethyl)nicotinamide, anti-inflammatory, anti-bacterial, formaldehyde release
